OPERATION INSTRUCTION

Magnetically Coupled Centrifugal Pumps of Types RM 1
Made of PP, PVDF or stainless steel
EG-Konformitätserklärung
EC Declaration of Conformity
Déclaration de Conformité CE

Hiermit erklären wir, dass die SONDERMANN magnetisch gekoppelten Kreiselpumpen in den gelieferten Werkstoffen und Ausführungen, folgenden einschlägigen Bestimmungen entsprechen:

We herewith confirm that the SONDERMANN magnetically coupled centrifugal pumps in the supplied materials and versions corresponds to the following EC-rules:

Nous confirmons que les pompes centrifuges à accouplement magnétique SONDERMANN, livrées en matériaux et versions différents, sont conformes aux dispositions réglementaires suivantes:

(1) EG-Maschinenrichtlinie 2006/42/EG  
EC Machinery Directive 2006/42/EG  
Directive CE Machines 2006/42/CG  
Die Schutzziele der Niederspannungs-Richtlinie werden gemäß Anhang I, Nr. 1.5.1 der 2006/42/EG eingehalten.  
The protection objectives of the low-voltage directive are realized according annex I, No. 1.5.1 of 2006/42/EG.  
Le protection de bas voltage considerer de appendice I, Numero 1.5.1 de 2006/42/EG.

(2) Elektromagnetische Verträglichkeit 2004/108/EG  
Electromagnetic Compatibility 2004/108/EG  
Compatibilité électromagnétique 2004/108/EG

(3) Harmonisierte Normen insbesondere EN 809  
Harmonized standards in particular EN 809  
Norme en vigueur en particulier EN 809

1 General information

The pump may only be used in the range of applications authorized by the manufacturer. In case of modified operating conditions, please consult your pump’s supplier and/or the manufacturer.

1.1 Fields of application:
- Pumping low-viscosity liquids resembling water.
- Pumping of acids, bases and others.
- Pumping of gaseous fluids.
- Any use other than the authorized one as well as any conversion of the pump is not permitted.

CAUTION!

Make sure that the materials of which the pump is made, are resistant to the fluids delivered.
Ask your pump’s supplier or the manufacturer for the respective chemical resistance list.

- If you deliver crystallising fluids, make sure that the fluid does not crystallise within the pump. Should this happen, carefully rinse off all parts being in contact with the fluid once the pump has been shut off.

NOTE

Disassembly of the pump will cancel the right to all warranty claims!

1.2 Power ratings

The nameplate on the pump not only specifies its model type but also its operating data and serial number. Please indicate all these data when inquiring about an issue, reordering parts and especially when ordering spare parts. For further information, contact your pump’s supplier or the manufacturer.

1.2 Technical data

(See also appendix)

</tbody>
</table>

NOTE

To find out the maximum admissible temperature of the fluid delivered, check out the materials of which the pump is made and which are indicated on the nameplate or the delivery note.
The letters written on the nameplate are to be read as follows:

PP = glass-fibre reinforced polypropylene
PVDF = polyvinylidene fluoride
VA = stainless steel
K = oxide ceramic
G = PTFE graphite
V = gasket*)
K = ceramic sleeve bearings
K = ceramic starting ring of the pump housing
K = ceramic centering shaft

*) materials available:
V = FKM (fluorinated rubber)
E = EPDM (ethylene-propylene terpolymer)
T = FEP (fluorinated ethylene propylene) coated

2 Safety
When installing, operating and maintaining the pump, the mounting and operating instructions detailed in the following should be strictly observed. Hence it is absolutely necessary that prior to assembling and starting the pump, the responsible installation personnel and/or users carefully read these operating instructions. Make sure that they are always available wherever the pump is used.

Not only the safety instructions detailed in this Safety chapter are to be observed but also the specific safety instructions provided in the following chapters.

2.1 Marking of safety instructions in this operating manual
Safety instructions given in this manual and non-compliance with which could be injurious to human beings, are identified by the general

WARNING! safety sign acc. to German DIN 4844-W9 standard.

Warnings of electricity are identified by the specific

WARNING safety sign acc. to German DIN 4844-W standard.

Safety instructions non-compliance with which would give rise to malfunctions of the equipment are identified by

CAUTION!

Signs and labels affixed to the equipment such as
• arrows indicating the sense of rotation,
• symbols indicating fluid connections,
• warnings to protect the pump from dry-running,
must be strictly observed and always kept legible.
2.2 Qualification and training of operating personnel

All personnel responsible for operation, maintenance, inspection and assembly of the pump must be adequately qualified. Scope of responsibility and supervision of the personnel must be exactly defined by the plant operator. If staff members do not have the necessary knowledge, they should be trained and instructed accordingly. If necessary, the pump manufacturer or supplier will hold this training on behalf of the plant operator. The operator should also make sure that all operating instructions are fully understood by all personnel.

2.3 Hazards in the event of non-compliance with safety instructions

Non-compliance with safety instructions may produce a risk to personal life and health as well as to the environment and the pump and may result in a loss of any right to claim damages. Non-compliance may involve risks such as

- failure of important functions of the pump and/or the installation;
- failure of specified procedures of service and maintenance;
- exposure of persons to electrical, mechanical, magnetic and chemical hazards;
- endangering of the environment because of hazardous substances leaking.

2.4 Working in compliance with safety regulations

When operating the pump, make sure to observe the safety instructions contained in this manual as well as the relevant national accident prevention regulations and any other service and safety instructions issued by the plant operator.

2.5 Safety instructions relevant for operating the pump

- If hot or cold machine components create any risk, they must be guarded against accidental contact.
- Guards for moving parts must not be removed from the equipment during operation.
- Hazardous (i.e. toxic, hot) fluids must be drained off to prevent any risk to persons or the environment. Statutory regulations are to be complied with in any case.
- Any hazard resulting from electricity should be ruled out completely. (For details see the German VDE specifications and the bye-laws of your local power supply utilities, for example.)

2.6 Safety instructions relevant for maintenance, inspection and assembly work

It shall be the plant operator’s responsibility to ensure that all maintenance, inspection and assembly work is performed by authorized and
qualified personnel who have adequately familiarized themselves with the subject matter by studying this manual in detail. Any work on the equipment shall only be performed when it is at a standstill. Make sure to strictly follow the procedure for shutting down the equipment prescribed in this manual.

Pumps and pump units that deliver hazardous fluids must be decontaminated after use.

On completion of work all safety and protective guards must be re-installed and be fully operational again.

Prior to restarting the pump, make sure to follow the instructions detailed in the Starting chapter below.

2.7 Unauthorized alterations and production of spare parts

The user is not allowed to subject the pump to any modification unless agreed upon with the manufacturer. It is in the interest of your safety to use genuine spare parts and accessories authorized by the manufacturer. Use of other parts may exempt the manufacturer from any liability resulting thereof.

3 Transportation and storage

3.1 Transportation

The pump leaves the manufacturer's production site in a ready-to-work state. In the event of damages occurring during and due to transportation, the forwarding agent has to make a factual statement. The equipment should always be transported according to good professional practice.

3.2 Storage

The pump has to be stored absolutely dry and be protected from any pollutants entering.

4 Functional characteristics and accessories

4.1 General description

Magnetically coupled centrifugal pumps of type RM are non-self-priming centrifugal pumps. They operate in horizontal position and are made of plastic in monobloc design. A magnetic coupling connects the pump to the motor and transmits the power of the motor to the impeller.

4.2 Conctructional design

Housing, impeller, impeller magnet and rear casing are made of plastic. Standard pumps are equipped with centering shafts and bearings made of oxide ceramic. The rear casing hermetically seals the fluid from the ambient atmosphere. Because of magnetic power transmission, there is no need to mechanically seal the shaft. So, in contrast to mechanically or gland sealed pumps, leakages through worn shaft sealings are definitely ruled out.
This pump is magnetically coupled. So when handling permanent-magnet components during repair or maintenance work you are exposed to magnetic forces which might influence pacemakers, for example.

⚠️ Keep your distance.

The pump housing parts are sealed by static O-rings. The impeller of the pump is a radial-flow wheel. Depending on the fluid delivered, each component of the pump is available in various materials.

NOTE

The materials used for the pump are specified on its nameplate or the delivery note.

Choice of materials:
depends of type, see nameplate

<table>

4.3 Accessories and optional equipment

Accessory components including hose connections, pilotherms, motor circuit-breakers and flow monitors, are available on request.

5 Mounting and installation

The pump should be installed at a place that allows easy access at any time. Make sure to keep to the following limit values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ambient temperature</td>
<td>-10°C to +40°C</td>
</tr>
<tr>
<td>Humidity of the air</td>
<td>max. 95% relative humidity, non-condensing</td>
</tr>
</tbody>
</table>

NOTE

In case of higher ambient temperatures, please contact your pump’s supplier or the manufacturer.

5.1 Mounting

The pump is usually mounted in horizontal position, vertical position only upon request.

This pump is not self-priming and therefore requires a feed line.
5.2 Hose and pipe lines

Make sure that the cross-sections of the pipelines fit the suction and discharge ports. All suction and discharge lines to the pump housing should be free of tensile stress. The weight of the hose and pipe lines must not rest on the housing.

**CAUTION!**

*Do not install any quick-acting stop valves into the pipelines, since pressure jerks will damage the pump housing.*

5.2.1 Suction line

- The suction line should be a tube or hose which will not deform by the resulting partial vacuum or by high temperatures.

- The suction line should be as short as possible. Make sure to mount it so that there will be no gas accumulation.

- When dimensioning pipelines, fittings etc., make sure to keep the flow resistances as low as possible.

- Flow velocity within the fitted suction line should not exceed the limit of 1m/s.

- For easy installation and removal of the pump, a shut-off valve (but no diaphragm valve) should be built into the suction line.

**CAUTION!**

*Do not use the shut-off valve built into the suction line to adjust the delivery rate.*

5.2.2 Discharge line

- Standard flow velocity within the discharge line is 3m/s.

- To adjust the flow rate, we recommend installing a control element to the discharge line.

5.3 Electrical connection

All electrical connections to the pump should be performed by experts only.

The electrical connections had to be done according to the following schematic (depends of the motor type; single phase or three phase, see nameplate):
Single phase motor:

- All electrical connections and installations of additional protection devices should be performed by experts only and in accordance with the instructions of your local power supplier and/or the Association of German Electrotechnical Engineers VDE.

- The motor must be equipped with a motor circuit-breaker or a pilotherm to protect it from overloading.

**NOTE**

Motor protection devices are available with the pump’s manufacturer.

Three phase motor:

- Make sure that the power supply has been cut off for at least 5 minutes before you start working on the terminal box of the pump.

- Check out whether the power supply available corresponds to the data given on the nameplate.

5.4 Check sense of rotation

**CAUTION!**

Do not check the sense of rotation before the pump is filled with fluid.

- Fill the pump housing and the suction line with water or the fluid to be delivered.

- Check the sense of rotation of the motor by switching it on and off in immediate succession. The sense of rotation must be in accordance with the arrow figuring on the pump. Slip a soft material, such as a paper strip, into the slits of the motor skirt to determine the sense of rotation.
• Mind the sense of rotation indicated by an arrow on the pump and verify it after installation.

6 Starting and shut-down procedures

6.1 Preparations for starting
Always wear protective clothing.
• Fill the pump housing and the suction line with water or the fluid to be delivered.

CAUTION!
Avoid any dry-running of the pump!

NOTE
We recommend installing dry-running protection devices such as flow monitors, contact manometers, differential pressure switches or level controllers.

• Tighten all screwed connections.
• Entirely open all valves of the suction line.

6.2 Starting the pump
• Switch on the motor.
• Check the sense of rotation.

• Adjust the operating point by slowly opening the shut-off valve of the discharge line. If there is no shut-off valve installed to the discharge line, the operating point is automatically adjusted in accordance with the characteristic curve of the pump.

CAUTION!
Do not run the pump with the discharge line closed for a longer period of time. This may result in heating up the fluid inside the pump housing and damaging interior components of the pump.

CAUTION!
Always protect the pump from coarse impurities and magnetisable metal particles within the fluid delivered.

6.3 Operation
If the motor-circuit breaker switched off the pump motor, proceed as follows:
• Before switching on the motor again, check whether the impeller turns readily.
• Make sure that the suction line and the pump housing are filled with fluid.
• Switch on the motor.

If the pump delivers for a short period of time only and then stops pumping, the magnetic coupling has been disengaged. Proceed as described in chapter 8, Troubleshooting, below.

6.4 Shut-down procedure
• Switch off the motor.
• Close all valves.
• In case some fluid remains within the pump, secure the shut-off valves to prevent an accidental opening.
• If the pump is not to be used for some time, carefully rinse it off with a clean and neutral liquid. This is to prevent remaining fluid from depositing within the pump and the sleeve bearings.

• If the pump is shut down for repair or maintenance work, lock the driving unit so that it cannot be switched on. Before dismantling the pump, close the suction and the discharge lines and empty the pump under controlled conditions. Secure all valves to prevent an accidental opening. Wear protective clothing.

6.5 Waste disposal
This product as a whole as well as parts of it should be disposed of in an environmentally safe way.

7.2 Preventive maintenance
• Although bearings, centering shaft and starting rings are designed for continuous operation, they should be periodically inspected for deposits.

• If dirty, silty or crystallising fluids are delivered, the pump should be inspected more often and cleaned, if necessary.

• Check the static sealings in regular intervals and replace them, if necessary.

• If not only wear parts are replaced, but also repair work is to be done, this should be performed by an expert only. Inappropriate service and maintenance work often results in a waste of money.

CAUTION!
When assembling or disassembling the pump, make sure that there are no magnetisable metal particles in the working area.

When the complete head of the pump is assembled or disassembled, magnetic forces can cause serious injury.

CAUTION!
Please comply with the respective regulations that are currently in force at your place (especially with regard to electronic scrap).

7 Service and maintenance
7.1 General information
This pump is designed for continuous operation and does not require specific maintenance.
7.3 Dismantling the pump head

1. Loosen the 6 screws (901.1) of the pump housing. (101)
   
   *Required tool: open-end or ring spanner of size 10*

2. Take the pump head (001) from lantern (113).
   
   *No tools required.*

3. Take the pump housing (101) off the rear casing (161). Pull the impeller with the inner magnet (847.2) and the centering shaft (211) out of the housing.
   
   *No tools required.*

4. Take the starting ring (314.1) off the pump housing (101).
   
   *Required tool: centering shaft (211).*

5. Take the starting ring (314.2) off the rear casing (161).
   
   *Required tool: centering shaft (211).*
7.4 Assembling the pump head

To assemble the pump head reverse steps 1 to 5 described above.

CAUTION!

*Once the complete head of the pump has been assembled, the impeller (230) and the impeller magnet (847.1) should be sliding along the axis of the centering shaft (211).*

<td>The pump is damaged because of solids or dry-running.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Have the pump dismantled and repaired by an expert.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

*If the pump runs dry, the inner magnet usually bonds with the rear casing. Because of the impeller rotation, the fluid remaining in the pump housing heats up and evaporates. As the resulting frictional heat cannot be removed, the plastic material of the casing plasticizes and bonds with the inner magnet by “friction bonding”. So do not run the pump with the discharge or the suction line closed for a longer period of time. Once the pump has run dry, liquid will leak out of the bore hole of the lantern between pump and motor. This means that the bonding of the interior parts with each other has resulted in a leaky rear casing.*

Items marked with an * are wear parts.

**NOTE**

When ordering spare parts, please indicate the item number of the part desired as well as the type of the pump, its serial number, motor capacity and drawing number.

Measured with water at a temperature of 20°C.
10.4  Labour protection and accident prevention

In order to protect their employees and other people as well as the environment from harmful influences and effects when handling hazardous substances, industrial and commercial companies are obliged to comply with legal provisions referring to labour protection such as the German Workplace Regulations (ArbStättV), Hazardous Substances Regulations (GefStoffV) and regulations for the prevention of accidents, as well as environmental regulations such as the German Waste Act (AbfG) and the Water Resources Law (WHG).

We therefore ask you to enclose a declaration of harmlessness with any pump or component you send us for repair. With this form duly filled in and signed, you declare that the pump or the component was cleaned and thoroughly rinsed with neutral fluid before being shipped to us. Notwithstanding this, we reserve the right to refuse acceptance of repair orders for any other reason.

So SONDERMANN products and their components are neither serviced nor repaired unless this declaration of harmlessness is enclosed (see page 25 below).

Pumps that have been operated with radioactive substances are not accepted at all.

In case that, although the pump was carefully emptied and cleaned, we have to take any safety precautions, you have to give us the necessary information when sending the pump or its component.
10.5 Declaration of harmlessness

The undersigned herewith declares that the following pump and its accessories are harmless and asks you to service and/or repair it or them.

Type of the pump:
...................................................................................................................................................
...................................................................................................................................................

Serial number:
.............................................................................................................................

Date of delivery:
.............................................................................................................................

Kind of problem:
...................................................................................................................................................
...................................................................................................................................................

We herewith declare that

the pump was not used to deliver harmful or noxious substances;

☐ it was used with the following fluids:
...................................................................................................................................................
...................................................................................................................................................

☐ before being shipped, the pump was carefully emptied and cleaned inside and out;

☐ it is not necessary to take any special safety precautions;

☐ you have to take the following safety precautions with regard to residual fluids and waste disposal:
...................................................................................................................................................
...................................................................................................................................................
